

WONG MAN NAM

COMPUTER SCIENCE STUDENT
WEB DEVELOPER
UI/UX LEARNER

SUMMARY

I am a computer science student in Hong Kong with a strong interest in web development, system design, and practical software solutions. My work focuses on building useful web-based systems that combine backend logic, user interface design, and real-world workflow thinking. I have experience developing Flask-based applications, responsive web interfaces, and project features related to tracking, storage management, and hardware-connected systems.

EXPERIENCE

Project : SmartBin Storage and Tracking System

- Built a Flask-based storage and tracking web application for automated bin management.
- Designed separate user and developer modes for different system roles.
- Added QR-code-based retrieval, activity logging, and image support for item management.
- Improved backend logic, workflow design, and web UI structure through this project.

INTERESTS

I am especially interested in full-stack web development, UI/UX improvement, system optimization, and practical software projects that solve real problems. I am also exploring related skills such as video editing and digital presentation as additional strengths for freelance and future career opportunities.

GOAL

My goal is to continue improving as a developer who can build useful, clear, and user-friendly systems. I want to strengthen both my technical development skills and my design thinking so I can prepare for future internships, freelance work, and long-term software career opportunities.

EDUCATION

2024-2026

HKUSPACE

Associate of engineering
